ABSTRACT

This document examines 8-year trends in the labor force status and other characteristics (including age and years of school completed) of persons with a work force disability, using March supplements to the U.S. Census Bureau's Current Population Survey (CPS). (Disabled persons are considered to be individuals 16 to 64 years old with a disability that prevents them from working or that limits the kind or amount of work they can do.) The CPS data are collected by interviewers who ask questions about each household member 14 years or older in every sample household. The number of housing units eligible for interviewing in the sample ranged from 65,500 in 1980 and 1981 to 57,000 in 1988. Among the findings are the following: (1) the poor were more likely to be disabled workers compared to those with a more comfortable income level; (2) Blacks were more likely to have a work disability than Whites or Hispanics; (3) the incidence of work disabilities is significantly higher among males 55 to 64 than among males 25 to 34, among people who have less than an eighth-grade education than among high school or college graduates, and among persons who live in poverty; (4) disabled males were unemployed at a rate of 14 percent over the 1983 to 1988 period, and men without disabilities were unemployed at a 6 percent rate; and (5) in 1988, 14 percent of women with disabilities were unemployed, compared to 5 percent of women who were not disabled; and (6) the unemployment rate for men with and without disabilities peaked in 1983. The document contains detailed data tables and copies of the questionnaire. (CML)

Introduction 1
Measuring work disability status in the March CPS 1
Work disability: 1981 to 1988 2
1988 data on characteristics of persons with a work disability 2

TEXT TABLES

A. Number of persons 16 to 64 years old with a work disability by individual criteria: 1988 3
B. Persons 16 to 64 years old with a work disability: 1981 to 1988 3
C. Labor force status of civilians 16 to 64 years old during the survey week, by work disability status: 1981 to 1988 4
D. Mean earnings of civilian workers 16 to 64 years old, by work disability status: 1980 to 1987 4
E. Percent of persons 16 to 64 years old with a work disability, by selected characteristics: 1988 5
F. Labor force status by work disability status, persons 16 to 64 years: 1988 6
G. Mean earnings of workers 16 to 64 years old, by work disability status: 1987 8
H. Percent of workers covered by employer-provided health insurance, by work disability status: 1987 9
I. Work disability status of persons 65 to 74 years old: 1988 9

DETAILED TABLES

1. Persons 16 to 64 years old with a work disability, by sex, race, and Hispanic origin: 1981 to 1988 11
2. Age—persons 16 to 64 years old with a work disability, by sex, race, and Hispanic origin: 1981 to 1988 13
3. Selected characteristics of persons 16 to 64 years old with a work disability, by sex: 1988 22
4. Labor force status of civilians 16 to 64 years old, by work disability status and sex: 1988 28
5. In the labor force—civilians 16 to 64 years old with a work disability, by sex: 1988 .. 34
6. Occupation, industry, class of worker, pension, and health plan coverage in 1987—employed persons 16 to 64 years old, by work disability status, race, Hispanic origin, and sex: 1988 36
7. Work experience in 1987—work disability status of civilians 16 to 64 years old, by sex: 1988 40

8. Family status and mean income in 1987—work disability status of persons 16 to 64 years old, by sex: 1988 46
9. Work experience and mean earnings in 1987—work disability status of civilians 16 to 64 years old, by sex: 1988 52
10. Persons 65 to 74 years old—work disability status, by employment, age, and sex: 1988 58

Labor Force Status and Other Characteristics of Persons With a Work Disability: 1981 to 1988

INTRODUCTION

Since 1981, March supplements to the Current Population Survey (CPS) have contained several data items that provide information on work disability status. This report uses CPS data to examine eight-year trends in the labor force status and other characteristics of persons with a work disability.

This is the second Bureau of the Census report to present such data. The first report, *Labor Force Status and Other Characteristics of Persons With a Work Disability: 1982*, Series P-23, No. 127, was issued in July 1983. This report not only updates the information presented in the earlier report, but divides the population with a work disability into those with a severe disability and those with a disability that is not severe.

In order to interpret the data presented in this report, users should be aware of the basic concept of disability and the relationship of the basic concept to the operational concept adopted for the March household surveys. According to Saad Nagi, a major figure in the development of survey data on persons with disabilities, a person has a disability if he or she has a limitation in the ability to perform one or more of the life activities expected of an individual within a social environment.[1] The primary way this basic concept is operationalized in the March CPS is to ask whether any household member has a health problem or disability which prevents them from working or which limits the kind or amount of work they can do.

Users of this report should be aware that some of the persons who do not have a work disability do have impairments, functional limitations, or disabilities in life activities other than work. The term "impairment" indicates a physiological, anatomical, or mental loss or abnormality. The term "functional limitation" indicates a restriction in a physical functional activity (e.g., walking, reaching, hearing), an emotional functional activity (e.g., maintaining satisfactory personal relationships), or a mental functional activity (e.g. solving problems). Persons with a given level of functional limitation may or may not have a work disability depending on the individual environment (e.g., employer accommodation) and the reaction of the person.

[1]Saad Z. Nagi, "Disability Concepts and Prevalence," paper presented at first Mary Switzer Memorial Seminar, Cleveland, Ohio, May 1975.

Household survey estimates of the prevalence of work disability differ according to the content, design, and methodology of the survey. Surveys which focus on the topic of work disability and which ask separate questions about the work disability status of each adult in the household tend to produce higher prevalence estimates than surveys that give no special emphasis to work disability status and which depend on a screening question asked of a household respondent. The CPS is an example of the latter type of survey, and CPS estimates of the prevalence of work disabiltiy (8.6 percent of the working-age population in 1988) are lower than estimates from the Survey of Income and Program Participation (12.1 percent in 1984) and the National Health Interview Survey (11.5 percent in 1983-85). CPS data are not the best source for prevalence estimates. Their importance lies in the fact that they provide a reasonably consistent set of timeseries data on the labor force activity and earnings status of persons with a work disability.

MEASURING WORK DISABILITY STATUS IN THE MARCH CPS

A person is considered to have a work disability if one or more of the following conditions are met:

1. Identified by a question that asks "Does anyone in this household have a health problem or disability which prevents them from working or which limits the kind or amount of work they can do?"
2. Identified by a question that asks "Is there anyone in this household who ever retired or left a job for health reasons?"
3. Did not work in the survey week because of a long term physical or mental illness or disability which prevents the performance of any kind of work (based on the "main activity last week" question on the basic CPS questionnaire).
4. Did not work at all in previous year because ill or disabled (based on the "reason did not work last year" question on the March CPS supplement).
5. Under 65 years of age and covered by Medicare.
6. Under 65 years of age and a recipient of Supplemental Security Income (SSI).

If one or more of the final four conditions was met, the person was considered to have a severe work disability.

Table A presents a matrix showing the number of persons identified by each of the six criteria and the number identified by a given criteria who were also identified by other criteria. For example, of the 5.2 million persons identified by criteria 4 (did not work at all in previous year because ill or disabled); 4.7 million were also identified by criteria 1, 1.8 million were also identified by criteria 2, and 1.7 million were also identified by criteria 3.

WORK DISABILITY: 1981 TO 1988

Table B shows prevalence data for the years 1981 to 1988 by sex and severity of the work disability for persons 16 to 64 years of age. The data show little evidence of any trends over the period. It is true that the work disability rate among men was lower in 1988 than in 1981 (8.7 versus 9.5 percent), but for most of the period the rate among males showed no significant variation (the rate in 1987 was not statistically different than the rate during any of the years from 1982 to 1986).

The rate of severe disability among men showed no evidence of change over the period; the figure was 4.8 percent in 1981 and 4.9 percent in 1988. Among women, neither the overall rate nor the severe rate showed evidence of a change over the period. In 1981, the overall work disability rate among women was 8.5 percent and the severe rate was 4.7 percent. Seven years later, in 1988, the overall rate was 8.4 percent and the severe rate was 4.6 percent.

Table C shows data for men and women with and without a disability for three basic measures of labor force activity. The three measures include (1) percent in the labor force, (2) percent working at a full-time job, and (3) the rate of unemployment (the unemployment rate is based only on persons who are actively seeking work and excludes those who have left the labor force).

The labor force participation rate of men with a work disability was 35.7 percent in 1988, considerably lower than the 1981 figure of 41.9 percent, but the rate did not exhibit any particular trend over most of the eight-year period. For example, the 1987 rate of 39.7 percent was not statistically different from the 1982 rate of 41.5 percent. The labor force participation rate of men with no work disability was fairly stable over the period. The 1988 rate of 88.9 percent was slightly lower than the 1981 rate (89.4 percent) but was not statistically different from the 1982 rate of 88.8 percent.

In 1988, 23.4 percent of men with a work disability and 74.8 percent of men with no work disability were employed at a fulltime job. The 1988 figure for men with a work disability was lower than the 1981 figure of 29.8 percent, but the rate was relatively stable for much of the period. The 1987 rate of 26.3 percent was not statistically different from the 1982 rate of 27.4 percent. The proportion of men without a work disability who were employed at a full-time job was slightly higher in 1988 than in 1981 (74.8 percent versus 74.1 percent).

The two groups, men with and without a work disability, experienced their highest rates of unemployment in 1983. In that year, the unemployment rate was 19.6 percent among men with a work disability and 11.8 percent among men with no work disability. The rate declined for both groups over the 1983 to 1988 period, falling to 14.2 percent for those with a work disability and 6.2 percent for those with no work disability.

In contrast to the data for men, the data in table C do show a trend towards increased labor force actitivy among women with a work disability. During the 1981 to 1988 period, the proportion of women with a work disability who were in the labor force rose from 23.5 to 27.5 percent, and the proportion holding a full-time job rose from 11.4 to 13.1 percent. From 1981 to 1988 the labor force participation rate for women with no work disability increased from 63.9 to 69.5 percent and the proportion of this group holding full-time jobs increased from 41.6 to 47.1 percent. From 1983 to 1988, the unemployment rate among women with a work disability declined from 19.7 to 14.2 percent. The rate among women with no work disability declined from 9.5 percent to 5.2 percent over the same time period.

Based on earnings data, disabled persons of both sexes experienced a worsening in relative economic status from 1980 to 1987. Table D shows that the disabled to nondisabled annual earnings ratio among male workers fell from .77 in 1980 ($12,579 versus $16,362) to .64 in 1987 ($15,497 versus $24,095). Among female workers, the ratio declined from .69 in 1980 ($5,335 versus $7,770) to .62 in 1987 ($8,075 versus $13,000). The earnings ratio of year-round full-time male workers also showed a decline, dropping from .91 ($18,755 versus $20,642) to .81 ($24,200 versus $29,994). There was no statistically significant change in the earnings ratio among female year-round, full-time workers. The disabled to nondisabled ratio was .88 in 1980 ($10,568 versus $12,020) and .84 in 1987 ($15,796 versus $18,894).

1988 DATA ON CHARACTERISTICS OF PERSONS WITH A WORK DISABILITY

Table E presents data showing the relationship between work disability status and four highly correlated variables: age, schooling, income, and race. The likelihood of having a work disability is strongly related to age. Persons in the 55 to 64 years of age group are about four times as likely as persons in the 25 to 34 years of age group to have a work disability, and they are about five times as likely to have a severe work disability. The

[1]Universe is persons 25 to 64 years old.
[2]Persons of Hispanic origin may be of any race.

actual CPS disability rates by age group were 3.8 percent (persons 16 to 24 years old), 5.6 percent (25 to 34), 7.1 percent (35 to 44), 10.3 percent (45 to 54) and 22.3 percent (55 to 64). The overall relationship observed for those with a work disability held for both males and females.

The relationship between work disability status and years of school completed is also strong. Persons who have completed less than 8 years of school have a disability rate that is more than three times as high as the rate for high school graduates and eight times the rate for college graduates. The differences are even more pronounced when the severity of the disability is considered. Approximately 30 percent of all those with less than 8 years of schooling had a work disability compared to 8.8 percent of those with a high school education and 3.8 percent of those with a college degree. The proportions of persons in the three schooling groups with a severe work disability were 23.4 percent for those with less than 8 years of schooling, 4.5 percent for high school graduates, and 1.3 percent for college graduates. Part of the observed relationship between disability and schooling is caused by the relationship between schooling and age. Older persons tend to have less schooling than younger persons. But the data in detailed table 3 show that the inverse relationship between disability and specific school levels is highly significant within age groups. For example, among persons 45 to 54, the work disability rate was 21.3 percent for those without a high school diploma, 8.2 percent for high school graduates with no college diploma, and 4.3 percent for those who graduated from college.

The data do not allow for a determination of causality and it seems very likely that both directions are important. That is, disability has a causal effect on schooling, and schooling has a causal effect on disability. From a more basic point of view, it may be that high rates of disability and low levels of schooling are both caused by economic and social disadvantages experienced in childhood.

A third major correlate of work disability status is income. Table E shows data on the relationship between disability and the income to poverty ratio. The ratio is computed by comparing the person's family income (or his or her own income if the person is not a family member) to an official poverty threshold. A ratio of less than one means that the person is part of the official poverty population. The data show that 21.9 percent of the working-age population (persons 16 to 64 years) in

poverty in 1987 had a work disability. Among those who were near-poor (1.00 to 1.24 of the poverty threshold), 17.8 percent had a work disability. In contrast, among those with a more comfortable income level (an income at least twice that of the poverty threshold), only 5.6 percent had a work disability.

The final correlate shown in table E is race. Black persons had a much higher likelihood (13.7 percent) than Whites (7.9 percent) or persons of Hispanic origin (8.2 percent) of having a work disability. The differences were even larger when the severity of the disability was considered. The proportion of Blacks with a severe disability was 9.9 percent, more than twice the rate of Whites (4.1 percent) and 77 percent higher than the rate for persons of Hispanic origin (5.6 percent).

Among both males and females, the existence of a work disability makes a large difference on the likelihood of being in the labor force, of holding a full-time job, and of being unemployed. The effect of a work disability on labor force activity may differ, however, depending on other characteristics of the person.

[1]Universe is persons 25 to 64 years old.
[2]Persons of Hispanic origin may be of any race.

As shown in table F, age has a negative effect on the relative labor force participation rates of persons with a work disability, and schooling has a positive effect. Among males 25 to 34 years old, persons with a work disability had a labor force rate that was approximately one-half of those with no work disability (49.5 percent versus 96.2 percent). But among older males (55 to 64), the labor force participation rate of persons with a work disability was only one-fourth that of persons with no work disability (20.7 percent versus 80.5 percent).

The strong negative relationship between age and labor force participation observed for men was not as evident for women. The decline in labor force participation presumably reflects an increasing severity of disability although it may also reflect fewer employment opportunities. The data in table F show a strong positive relationship between schooling and labor force participation. The labor force participation rate of males with a work disability was 23.8 percent for nonhigh-school graduates, 38.2 percent for high-school graduates, and 50.3 percent for college graduates. Among females with a work disability, the comparable figures were 14.8, 29.5, and 46.5 percent.

The relationship between schooling and labor force participation can also be examined by comparing rates between those with a work disability and those with no work disability within given schooling categories. For example, among male high school graduates, those with a work disability had a labor force participation rate that was about 40 percent as high as the rate for those with no disability. But when the comparison was made among those with a college degree, the ratio increased to 52 percent. This observed relationship was not statistically significant for females.

Among White males with a work disability, 38.9 percent were in the labor force, and 26.2 percent held full-time jobs. Their unemployment rate was 12.9 percent. Among Black males, the comparable figures were 20.6 percent, 10.8 percent, and 25.0 percent. Among males of Hispanic origin, the figures were 28.2, 13.9, and 28.4 percent, respectively. Black females with a work disability were less likely to hold a full-time job and more likely to be unemployed than their White counterparts.

Earlier data showed the large impact that work disability has on the likelihood of being employed (particularly at a full-time job). Work disability also affects economic status by lowering the average level of earnings. Table G presents data from the March 1988 CPS showing earnings for calendar year 1987 by work disability status and other characteristics.

The earnings ratio (earnings of those with a work disability as a proportion of the earnings of those with no disability) shows no statistically significant variation by age. Among male year-round, full-time workers, the ratio was .87 for persons 25 to 34 years old, .80 for persons 35 to 44 years old, .73 for persons 45 to 54 years old, and only .68 for persons 55 to 64 years old.

Drawing conclusions from this age profile is difficult because information on the duration of the disability is lacking, but one possible explanation is the difference in schooling experience between those with and without a work disability. Persons with higher levels of schooling can expect to have higher returns to work experience, and persons with a work disability tend to have less schooling than those with no work disability. The schooling difference means that young persons with a work disability cannot look forward to the same rate of return to work experience as young persons with no work disability.

If the earnings disadvantage of males with a work disability increases with age, it appears to be also true that it increases with the level of education. Among male year-round, full-time workers, the earnings ratio was .90 for high school graduates, but only .79 for college graduates. Among males, at least, persons with a disability face two serious barriers to their chances of earning high levels of pay. First, they do not complete as many years of schooling as their counterparts with no work disability, and second, when they do complete college, they receive smaller financial rewards.

The pattern of earnings ratios is different for females than for males, primarily because the age-earnings profile for women is much flatter than the profile for men. The apparent returns to work experience are small for women whether or not they have a work disability. The relationship between the earnings ratio and schooling that was observed for men (the earnings ratio dropped as schooling increased) was not observed for women. The financial gain of having a college degree appeared to be about the same for both groups of women; those with a work disability and those without.

The existence of a work disability lowers labor force activity and earnings, and it also significantly lowers the chances of being covered by an employer-provided health plan. Table H shows that 52.1 percent of male workers with a work disability were covered by an employer health plan compared to 65.9 percent of males with no work disability. The overall pattern held for Whites and Blacks but was not evident for persons of Hispanic origin. A plausible reason for the latter finding is the low rate at which Hispanic-origin workers are covered by employer health plans.

The data presented above refer to the status of persons under 65 years of age. Table I shows data on the work disability and employment status of persons 65 to 74 years old. Many persons in this age group have voluntarily left the labor force, but many others are interested in working and the data show that work disability status has an important effect on employment status. Approximately one-fourth of the persons in this age group had a work disability, and the employment rate of those with a disability was considerably lower

[1]Persons of Hispanic origin may be of any race.
[2]Since medians were calculated using more detailed intervals than those shown above, they will not be the same as those calculated using the above intervals.

Appendix A: Definitions and Explanations

Population coverage. This report includes the civilian noninsitutional population of the United States and members of the Armed Forces in the United States living off post or with their families on post, but excludes all other members of the Armed Forces.

Work disability. Persons were classified as having a work disability if they met any of the following criteria:

1. Had a health problem or disability which prevents them from working or which limits the kind or amount of work they can do.
2. Had a service connected disability or ever retired or left a job for health reasons.
3. Did not work in survey week because of long- term physical or mental illness or disability which prevents the performance of any kind of work.
4. Did not work at all in 1987 because ill or disabled.
5. Under 65 years of age and covered by Medicare.
6. Under 65 years of age and recipient of SSI (Supplemental Security Income).

A person was further classified as having a severe work disability if any of the above criteria numbered 3 through 6 specifically applied.

Metropolitan areas. The general concept of a metropolitan area is one of a large population nucleus, together with adjacent communities which have a high degree of economic and social integration with that nucleus. The metropolitan statistical areas (MSA's) as defined in June 1984 are defined by the Office of Management and Budget for use in the presentation of statistics by agencies of the Federal Government. The former term SMSA was changed to MSA in 1983. An area qualifies for recognition as a MSA if (1) it includes a city of at least 50,000 population, or (2) it includes a Census Bureau defined urbanized area of at least 50,000 with a total metropolitan population of at least 100,000 (75,000 in New England). In addition to the county containing the main city or urban area, a MSA may include other counties having strong commuting ties to the central county.

The population living in MSA's are referred to here as "inside metropolitan areas." This population is further subdivided into "inside central cities" and "outside central cities." The population residing outside MSA's constitutes those "outside metropolitan areas."

Geographic regions. The four major regions of the United States for which data are presented in this report represent groups of States as follows:

Northeast: Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, and Vermont.

Midwest: Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, and Wisconsin.

South: Alabama, Arkansas, Delaware, District of Columbia, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, and West Virginia.

West: Alaska, Arizona, California, Colorado, Hawaii, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, and Wyoming.

Household. A household consists of all the persons who occupy a housing unit. A house, an apartment or other group of rooms, or a single room is regarded as a housing unit when it is occupied or intended for occupancy as separate living quarters; that is, when the occupants do not live and eat with any other persons in the structure and there is direct access from the outside or through a common hall. A household includes the related family members and all the unrelated persons, if any, such as lodgers, foster children, wards, or employees who share the housing unit. A person living alone in a housing unit, or a group of unrelated persons sharing a housing unit as partners, is also counted as a household. The count of households excludes group quarters.

Group quarters. All persons who are not members of households are regarded as living in group quarters. Group quarters contain five or more persons unrelated to the person in charge, such as residents of lodging and boarding houses. Persons living in military barracks and inmates of institutions were excluded from the survey.

Householder. The instructions call for listing first the person (or one of the persons) in whose name the home is owned or rented. If the house is owned jointly by a married couple, either the husband or the wife may be

listed first, thereby becoming the reference person, or householder, to whom the relationship of the other household members is recorded. One person in each household is designated as the "householder." The number of householders, therefore, is equal to the number of households. Beginning with the 1980 CPS, the Bureau of the Census began using the terms "householder" and "family householder" instead of "head of household" and "head of family."

Family. The term "family" refers to a group of two or more persons related by birth, marriage, or adoption who reside together; all such persons are considered as members of one family. For example, if the son of the person who maintains the household and the son's wife are members of the household, they are treated as members of the parent's family. Every family must include a householder; two or more people living in the same household who are related to one another, but are not related to the householder, form an "unrelated subfamily" and are not included in the count of families.

Subfamily. A subfamily is a married couple with or without children or one parent with one or more own single children under 18 years old living in a household but not including among its members the person or couple maintaining the household. Because a subfamily does not include a householder, it is by definition excluded from the count of families. There are two kinds of subfamilies, related and unrelated.

Related subfamily. A related subfamily is a subfamily whose members are related to the person or couple maintaining the household. The most common example of a related subfamily is a young married couple sharing the home of the husband's or wife's parents. Members of a related subfamily are also members of the householder's family.

Unrelated subfamily. Beginning with the 1980 CPS, unrelated subfamilies (referred to in the past as secondary families) are no longer included in the count of families, nor are the members of unrelated subfamilies included in the count of family members. An unrelated subfamily is a subfamily whose members are not related to the person or couple maintaining the household. Members of unrelated subfamilies may include such persons as guests, lodgers, or resident employees and their relatives living in a household. Unrelated subfamily members are not part of the householder's family.

Married couple. A married couple, as defined for census purposes, is a husband and wife enumerated as members of the same household. The married couple may or may not have children living with them. The expression "husband-wife" or "married-couple" before the term "household," or "family," indicates that the household, or family, is maintained by a husband or wife.

Unrelated individuals. The term "unrelated individuals" refers to persons 15 years old and over (other than inmates of institutions) who are not living with any relatives. An unrelated individual may (1) constitute a one-person household, (2) be part of a household including one or more other families or unrelated individuals, or (3) reside in group quarters such as a rooming house. Thus, a widow living by herself or with one or more other persons not related to her, a lodger not related to the householder or to anyone else in the household, and a servant living in an employer's household with no relatives are examples of unrelated individuals.

Nonfamily householder. A nonfamily householder (formerly called a primary individual) is a person maintaining a household while living alone or with nonrelatives only.

Secondary individual. A secondary individual is a person in a household or group quarters such as a guest, roomer, boarder, or resident employee (excluding nonfamily householders and inmates of institutions) who is not related to any other person in the household or group quarters.

Size of household, family, or subfamily. The term "size of household" includes all persons occupying a housing unit. "Size of family" includes the family householder and all other persons in the living quarters who are related to the householder by birth, marriage, or adoption.

Own children and related children under 18 years of age. "Own" children in a family are sons and daughters, including stepchildren and adopted children of the householder. "Related" children in a family include own children and all other children in the household who are related to the householder by blood, marriage or adoption.

Marital status. The marital status classification identifies four major categories: single, married, widowed, and divorced. These terms refer to the marital status at the time of the enumeration. The category "married" is further divided into "married, wife present," "separated," and "other married, wife absent" by reason for absence of husband for female householders. A male householder was classified as "married, wife present" if his wife was reported as a member of the household, even though she may have been temporarily absent on business or on vacation, visiting, in a hospital, etc., at the time of the enumeration. Persons reported as separated included those with legal separations, those living apart with intentions of obtaining a divorce, and other persons permanently or temporarily separated because of marital discord. The groups "other married, wife absent" and "other married, husband absent"

included married persons living apart because either the wife or the husband was employed and living at a considerable distance from home, was residing in an institution, and moved to another area, or had a different place of residence for any other reason except separation as defined above.

Age. The age classification is based on the age of the person at his last birthday.

Race. The population is divided into three groups on the basis of race: White, Black, and "other races." The last category includes Indians, Japanese, Chinese, and any other race except White and Black. "Other races" are sometimes shown in combination with the Black population.

Persons of Hispanic origin. Persons of Hispanic origin were identified by a question that asked for self-identification of the person's origin or descent. Respondents were asked to select their origin (and the origin of other household members) from a "flash card" listing ethnic origins. Persons of Hispanic origin, in particular, were those who indicated that their origin was Mexican, Puerto Rican, Central or South American, or some other Hispanic origin. It should be noted that persons of Hispanic origin may be of any race.

Years of school completed. Data on years of school completed were derived from the combination of answers to questions concerning the highest grade of school attended by the persons and whether or not that grade was finished. The questions of educational attainment apply only to progress in "regular" schools. Such schools included public, private, and parochial elementary and high schools (both junior and senior), colleges, universities, and professional schools (whether day schools or night schools). Thus, regular schooling is that which may advance a person toward an elementary school certificate, a high school diploma, or a college, university, or professional school degree. Schooling in other than regular schools was counted only if the credits obtained were regarded as transferable to school in the regular school system.

Labor force and employment status. The definitions of labor force and employment status relate to the population 15 years old and over.

Employed. Employed persons comprise (1) all civilians who, during the survey week did any work at all as paid employees or in their own business or profession, or on their own farm, or who worked 15 hours or more as unpaid workers on a farm or in a business operated by a member of the family and (2) all those who were not working but who had jobs or businesses from which they were temporarily absent because of illness, bad weather, vacation, or labor-management dispute, or because they were taking time off for personal reasons, whether or not they were paid by their employers for time off, and whether of not they were seeking other jobs. Excluded from the employed group are persons whose only activity consisted of work around the house (such as own home housework, and painting or repairing own home) or volunteer work for religious, charitable, and similar organizations.

Unemployed. Unemployed person are those civilians who, during the survey week had no employment but were available for work and (1) had engaged in any specifc jobseeking activity within the past 4 weeks such as registering at a public or private employment office, meeting with employers, checking with friends or relatives, placing or answering advertisements, writing letters of application, or being on a union or professional register; (2) were waiting to be called back to a job from which they had been laid off, or (3) were waiting to report to a new wage or salary job within 30 days.

Labor force. Persons are classified as in the labor force if they were employed as civilians, unemployed, or in the Armed Forces during the survey week. The "civilian labor force" comprises all civilians classified as employed or unemployed.

Not in the labor force. All civilians 15 years old and over who are not classified as employed or unemployed are defined as "not in the labor force." This group of persons who are neither employed nor seeking work includes persons engaged only in own home housework, attending school, or unable to work because of long-term physical or mental illness; persons who are retired or too old to work, seasonal workers for whom the survey week fell in an off season, and the voluntarily idle. Persons doing only unpaid family work (less than 15 hours during the survey week) are also classified as not in the labor force.

Work experience. A person with work experience is one who, during the preceding calendar year, did any civilian work for pay or profit or worked without pay on a family-operated farm or business at any time during the year, on a part-time or full-time basis.

Weeks worked in the income year. Persons are classified according to the number of different weeks, during the preceding calendar year, in which they did any civilian work for pay or profit (including paid vacations and sick leave) or worked without pay on a family-operated farm or business.

Part-time or full-time jobs. A person is classified as having worked at part-time jobs during the preceding calendar year if he worked at civilian jobs which provided less than 35 hours of work per week in a majority

of the weeks in which he worked during the year. He is classifed as having worked at full-time jobs if he worked 35 hours or more per week during a majority of the weeks in which he worked.

Year-round, full-time worker. A year-round, full-time worker is one who worked primarily at full-time civilian jobs for 50 weeks or more during the preceding calendar year.

Occupation, industry, and class of worker. Persons are classified according to the civilian job held during the survey week. Persons employed at two or more jobs were reported in the job at which they worked the greatest number of hours during the week. The occupation and industry groupings included in this report were based on the classification system used in the 1980 census.

Veterans status. A "veteran," as defined in this publication, is a male who has served but is not now serving on active duty in the Armed Forces of the United States. Information on veteran status was obtained only for males, not for females.

Income. For each person in the sample 15 years old and over, questions were asked on the amount of money income received in 1986 from each of the following sources: (1) money wages or salary; (2) net income from nonfarm self-employment; (3) net income from farm self-employment; (4) Social Security or railroad retirement; (5) Supplemental Security income; (6) public assistance or welfare payments; (7) interest (on savings or other investments which pay interest); (8) dividends, income from estates or trusts, or net rental income; (9) veterans' payments or unemployment and worker's compensation; (10) private pensions or government employee pensions; (11) alimony or child support, regular contributions from persons not living in the household, and other periodic income.

It should be noted that although the income statistics refer to receipts during the preceding year the characteristics of the person, such as age, and labor force status, and the composition of families refer to the time of the survey. The income of the family does not include amounts received by persons who were members of the family during all or part of the income year if these persons no longer resided with the family at the time of enumeration. On the other hand, family income includes amounts reported by related persons who did not reside with the family during the income year but who were members of the family at the time of enumeration.

All sources of income may be combined into two major types:

Total money earnings. The algebraic sum of money wage or salary and net income from farm and nonfarm self-employment.

Income other than earnings. The algebraic sum of all sources of money income except wages and salaries and income from self-employment. Data on consumer income collected in the CPS by the Bureau of the Census cover money income received (exclusive of certain money receipts such as capital gains) before payments for personal income taxes, Social Security, union dues, Medicare deductions, etc. Therefore, money income does not reflect the fact that some families receive part of their income in the form of noncash benefits such as food stamps, health benefits, and subsidized housing; that some farm families receive noncash benefits in the form of rent-free housing and goods produced and consumed on the farm; or that noncash benefits are also received by some nonfarm residents which often take the form of the use of business transportation and facilities, full or partial payments by business for retirement programs, medical and educational expenses, etc. These elements should be considered when comparing income levels. Moreover, readers should be aware that for many different reasons there is a tendency in household surveys for respondents to underreport their income. From an analysis of independently derived income estimates, it has been determined that income earned from wages or salaries is much better reported than other sources of income, and is nearly equal to independent estimates of aggregate income.

Median income. The median income is the amount which divides the distribution into two equal groups, one having incomes above the median, and the other having incomes below the median. The medians for families and unrelated individuals are based on all families and unrelated individuals. The medians for persons are based on persons with income.

Mean income. The mean income is the amount obtained by dividing the total income of a group by the number of units in that group. The means for families and unrelated individuals are based on all families and unrelated individuals. The means for persons are based on persons with income.

Poverty definition. Poverty statistics presented in this report are based on a definition developed by the Social Security Administration in 1964 and revised by Federal Interagency Committees in 1969 and 1980. The poverty index provides a range of income cutoffs adjusted by such factors as family size and number of children under 18 years old.

Food stamps. Food stamps are distributed through State and local welfare offices. The program is Federaly funded and is administered by the Food and Nutrition Service of the U.S. Department of Agriculture. The CPS questions on food stamps identify households in which one or more of the current members received food stamps during the previous year.

Public or other subsidized housing. There are several housing programs designed for families of low income. Among these, the most important are Low Rent Public Housing and Sections 8, 236, and 101 (rent supplements) of the U.S. Housing Act. Low rent public housing projects are owned, managed, and administered by a local housing authority. Partial financing may be provided by the State or the Department of Housing and Urban Development. Participation in public housing is determined by two factors: program eligibility and the availability of housing. Income standards for initial and continuing occupancy vary by local housing authority, although the limits are constrained by Federal guidelines. Rental charges, which, in turn, define net benefits, are set by a Federal statue not to exceed 25 percent of net monthly money income. A recipient unit can either be a family of two or more related persons or an individual who is handicapped, elderly, or displaced by urban renewal or natural disaster.

Two of the more common programs in which Federal, State, and local funds are used to subsidize private sector housing are Sections 8 and 101, rent supplement plans. The difference between the "fair market" rent and the rent charged to the tenant is paid to the owner by a government agency. Under an interest reduction program (e.g., Section 236), the amount of interest paid on the mortagage by the owner is reduced so that subsequent savings can be passed along to low-income tenants in the form of lower rent charges.

There were two questions dealing with public and low-cost housing on the March CPS supplement questionnaire. The first question identified residence in a housing unit owned by a public agency. The second question identified beneficiaries who were paying lower rent because of a government subsidy.

Medicaid. The Medicaid Program is administered by State agencies through grants from the Health Care Financing Administration of the Department of Health and Human Services. Funding of medical assistance payments consists of a combination of Federal, State, and in some cases, local funds.

Medicaid is for the most part a categorical program with complex eligibility rules which vary from State to State. There are two basic groups of eligible individuals: the categorically eligible and medically needy. The major categorically eligible groups are all Aid to Families with Dependent Children (AFDC) recipients and most Supplemental Security Income (SSI) recipients.

The Medicaid question of the March CPS attempted to identify all adults who were covered by Medicaid at any time during 1987. The term "covered" means enrolled in the Medicaid program, i.e., had a Medicaid (medical assistance) card or incurred medical bills which were paid for by Medicaid. In order to be counted, the person did not have to receive medical care paid for by Medicaid.

Medicare. The Medicare Program consists of two separate but complementary health plans designed to provide adequate medical care for the aged and disabled. The Basic Hospital Insurance Plan (Part A) provides basic protection against the costs of hospital and related post-hospital services. This plan also covers many persons under 65 years old who receive Social Security or Railroad Retirement benefits based on long-term disability. Part A is financed jointly by employers and employees through Social Security payroll deductions. Qualified persons 65 years old and over who are not otherwise eligible for Part A benefits may pay premiums directly to obtain this coverage. The Medical Insurance Plan (Part B) is a voluntary plan which builds upon the hospital insurance protection provided by the basic plan.

It provides insurance protection covering physicians' and surgeons' services and a variety of medical and other health services received either in hospitals or on an ambulatory basis. It is financed through monthly premium payments by each enrollee and subsidized by Federal general revenue funds.

The Medicare question on the March CPS attempted to identify all persons 15 years old and over who were covered by Medicare at any time during 1987. The term "covered" means enrolled in the Medicare Program. In order to be counted, the person did not necessarily have to receive care paid for by Medicare.

Employer- or union-provided group health insurance plans. The March CPS collected a limited amount of information on employer- and unionprovided group health insurance for civilian persons 15 years old and over who worked during 1987. Workers who participated in group health insurance plans of any kind were asked whether or not their employer or union helped pay for all, part, or none of the health insurance premium for 1987.

Employer- or union-provided pension plans. Civilian persons 15 years old and over who worked during 1987 were asked about their participation in pension plans provided by employers or unions.

Rounding. Percentages are rounded to the nearest tenth of a percent; therefore, the percentages in a distribution do not always add to exactly 100.0 percent. The totals, however, are always shown as 100.0. Moreover, individual figures are rounded to the nearest thousand without being adjusted to group totals, which are independently rounded; percentages are based on the unrounded numbers.

Base figures. The base figures shown are based on civilian noninstitutional population controls for age, race, and sex established by the 1980 census.

Appendix B. Source and Accuracy of the Estimates

SOURCE OF DATA

Most estimates in this report come from data obtained in March of years 1981 through 1988 in the Current Population Survey (CPS). The Bureau of the Census conducts the survey every month, although this report uses mostly March data for its estimates. The March survey uses two sets of questions, the basic CPS and the supplement.

Basic CPS. The basic CPS collects primarily labor force data about the civilian noninstitutional population. Interviewers ask questions concerning labor force participation about each member 14 years old and over in every sample household.

The present CPS sample was selected from the 1980 Decennial Census files with coverage in all 50 States and the District of Columbia. The sample is continually updated to account for new residential construction. It is located in 729 areas comprising 1,973 counties, independent cities, and minor civil divisions. About 59,500 occupied households are eligible for interview every month. Interviewers are unable to obtain interviews at about 2,500 of these units because the occupants are not home after repeated calls or are unavailable for some other reason.

Since the introduction of the CPS, the Bureau of the Census has redesigned the CPS sample several times to improve the quality and reliability of the data and to satisfy changing data needs. The most recent changes were completely implemented in July 1985.

The following table summarizes changes in the CPS designs for the years for which data appear in this report.

Description of the Current Population Survey

Time period	Number of sample areas	Housing units eligible[1]	
		Interviewed	Not interviewed
1986 to 1988	729	57,000	2,500
1985	[2]629/729	57,000	2,500
1982 to 1984	629	59,000	2,500
1980 to 1981	629	65,500	3,000

[1]Excludes about 2,500 Hispanic-origin households added from the previous November sample. (See "March Supplement.")

[2]The CPS was redesigned following the 1980 Decennial Census of Population and Housing. During phase-in of the new design, housing units from the new and old designs were in the sample.

March supplement. In addition to the basic CPS questions, interviewers asked supplementary questions in March about work status and work disability.

In order to obtain more reliable data for the Hispanic-origin population, the March CPS sample was increased by about 2,500 eligible housing units, interviewed the previous November, that contained at least one sample person of Hispanic origin. In addition, the sample included persons in the Armed Forces living off post or with their families on post.

Estimation procedure. This survey's estimation procedure inflates weighted sample results to independent estimates of the civilian noninstitutional population of the United States by age, sex, race, and Hispanic/non-Hispanic categories. The independent estimates were based on statistics from decennial censuses of population; statistics on births, deaths, immigration and emigration; and statistics on the size of the Armed Forces. The independent population estimates used from 1981 to the present were based on updates to controls established by the 1980 decennial census. Data previous to 1981 were based on independent population estimates from the most recent decennial census. For more details on the change in independent estimates, see the section entitled "Introduction of 1980 Census Population Controls" in an earlier report (Series P-60, No. 133). The estimation procedure for the March supplement included a further adjustment so husband and wife of a household received the same weight.

The estimates in this report for 1985 and later also employ a revised survey weighting procedure for persons of Hispanic origin. In previous years, weighted sample results were inflated to independent estimates of the noninstitutional population by age, sex, and race. There was no specific control of the survey estimates for the Hispanic-origin population. Since then, the Bureau of the Census developed independent population controls for the Hispanic-origin population by sex and detailed age groups. Revised weighting procedures incorporate these new controls. The independent population estimates include some, but not all, undocumented immigrants.

ACCURACY OF ESTIMATES

Since the CPS estimates come from a sample, they may differ from figures from a complete census using

the same questionnaires, instructions, and enumerators. A sample survey estimate has two possible types of error: sampling and nonsampling. The accuracy of an estimate depends on both types of error, but the full extent of the nonsampling error is unknown. Consequently, one should be particularly careful when interpreting results based on a relatively small number of cases or on small differences between estimates. The standard errors for CPS estimates primarily indicate the magnitude of sampling error. They also partially measure the effect of some nonsampling errors in responses and enumeration, but do not measure systematic biases in the data. (Bias is the average over all possible samples of the differences between the sample estimates and the desired value.)

Nonsampling variability. Nonsampling errors can be attributed to many sources. These sources include the inability to obtain information about all cases in the sample, definitional difficulties, differences in the interpretation of questions, respondents' inability or unwillingness to provide correct information or to recall information, errors made in data collection such as in recording or coding the data, errors made in processing the data, errors made in estimating values for missing data, and failure to represent all units with the sample (undercoverage).

CPS undercoverage results from missed housing units and missed persons within sample households. Compared to the level of the 1980 decennial census, overall CPS undercoverage is about 7 percent. CPS undercoverage varies with age, sex, and race. Generally, undercoverage is larger for males than for females and larger for Blacks and other races combined than for Whites. As described previously, ratio estimation to independent age-sex-race-Hispanic population controls partially corrects for the bias due to undercoverage. However, biases exist in the estimates to the extent that missed persons in missed households or missed persons in interviewed households have different characteristics from those of interviewed persons in the same age-sex-race-Hispanic group. Furthermore, the independent population controls have not been adjusted for undercoverage in the 1980 census.

For additional information on nonsampling error including the possible impact on CPS data when known, refer to Statistical Policy Working Paper 3, *An Error Profile: Employment as Measured by the Current Population Survey*, Office of Federal Statistical Policy and Standards, U.S. Department of Commerce, 1978 and Technical Paper 40, *The Current Population Survey: Design and Methodology*, Bureau of the Census, U.S. Department of Commerce.

Sampling variability. Sampling variability is variation that occurred by chance because a sample was surveyed rather than the entire population. Standard errors, as calculated by methods described later in "Standard Errors and Their Use," are primarily measures of sampling variability, although they may include some nonsampling errors. The sample estimate and its standard error enable one to construct a confidence interval, a range that would include the average result of all possible samples with a known probability. For example, if all possible samples were surveyed under essentially the same general conditions and using the same sample design, and if an estimate and its standard error were calculated from each sample, then approximately 90 percent of the intervals from 1.6 standard errors below the estimate to 1.6 standard errors above the estimate would include the average result of all possible samples.

A particular confidence interval may or may not contain the average estimate derived from all possible samples. However, one can say with specified confidence that the interval includes the average estimate calculated from all possible samples.

Some statements in the report may contain estimates followed by a number in parentheses. This number can be added to and subtracted from the estimate to calculate upper and lower bounds of the 90-percent confidence interval. For example, if a statement contains the phrase "grew by 1.7 percent (±1.0)," the 90-percent confidence interval for the estimate, 1.7 percent, is 0.7 percent to 2.7 percent.

Standard errors may also be used to perform hypothesis testing, a procedure for distinguishing between population parameters using sample estimates. The most common type of hypothesis appearing in this report is that the population parameters are different. An example of this would be comparing the unemployment rate for Blacks to the unemployment rate for Whites.

Tests may be performed at various levels of significance, where a significance level is the probability of concluding that the characteristics are different when, in fact, they are the same. All statements of comparison in the text have passed a hypothesis test at the 0.10 level of significance or better. This means that the absolute value of the estimated difference between characteristics is greater than or equal to 1.6 times the standard error of the difference.

Comparability of data. Data obtained from the CPS and other sources are not entirely comparable. This results from differences in interviewer training and experience and in differing survey processes. This is an example of nonsampling variability not reflected in the standard errors. Use caution when comparing results from different sources.

Caution should also be used when comparing estimates in this report, which reflect 1980 census-based population controls, with estimates for 1980 and earlier years, which reflect 1970 census-based population controls. This change in population controls had relatively

little impact on summary measures such as means, medians, and percentage distributions, but did have a significant impact on levels. For example, use of 1980 based population controls results in about a 2-percent increase in the civilian noninstitutional population and in the number of families and households. Thus, estimates of levels for data collected in 1981 and later years will differ from those for earlier years by more than what could be attributed to actual changes in the population. These differences could be disproportionately greater for certain subpopulation groups than for the total population.

Since no independent population control totals for persons of Hispanic origin were used before 1985, compare Hispanic-origin estimates over time cautiously.

Note when using small estimates. Summary measures (such as medians and percentage distributions) are shown only when the base is 75,000 or greater. Because of the large standard errors involved, summary measures would probably not reveal useful information when computed on a smaller base. However, estimated numbers are shown even though the relative standard errors of these numbers are larger than those for corresponding percentages. These smaller estimates permit combinations of the categories to suit data users' needs. Take care in the interpretation of small differences. For instance, even a small amount of nonsampling error can cause a borderline difference to appear significant or not, thus distorting a seemingly valid hypothesis test.

Standard errors and their use. A number of approximations are required to derive, at a moderate cost, standard errors applicable to all the estimates in this report. Instead of providing an individual standard error for each estimate, generalized sets of standard errors are provided for various types of characteristics. Thus, the tables show levels of magnitude of standard errors rather than the precise standard errors.

Standard errors of estimated numbers. There are two ways to compute the approximate standard error, s_x, of an estimated number shown in this report. The first uses the formula

$$s_x = fs \qquad (1)$$

where f is a factor from table B-3, and s is the standard error of the estimate obtained by interpolation from table B-1. The second method uses formula (2), from which the standard errors in tables B-1 and B-2 were calculated . This formula will provide more accurate results than formula (1).

$$s_x = \sqrt{ax^2 + bx} \qquad (2)$$

Here x is the size of the estimate and a and b are the parameters in table B-3 associated with the particular type of characteristic. When calculating standard errors for numbers from cross-tabulations involving different characteristics, use the factor or set of parameters for the characteristic which will give the largest standard error.

Illustration of the computation of the standard error of an estimated number. Table B shows that there were 3,791,000 males with a severe work disability in 1988. Using formula (1) with f = 0.9 from table B-3 and s = 91,000 by interpolation from table B-1 gives the approximate standard error of 82,000 = 0.9 x 91,000.

Using formula (2) with a = -0.000023 and b = 2,013, the approximate standard error is:

$$s_x = \sqrt{(-0.000023)\,(3{,}791{,}000)^2 + (2{,}013)(3{,}791{,}000)} = 85{,}000.$$

Using the 85,000 estimate of standard error, the 90-percent confidence interval as shown by the data is from 3,655,000 to 3,927,000. Therefore, a conclusion that the average estimate derived from all possible samples lies within a range computed in this way would be correct for roughly 90 percent of all possible samples.

Standard errors of estimated percentages. The reliability of an estimated percentage, computed using sample data for both numerator and denominator, depends on the size of the percentage and its base. Estimated percentages are relatively more reliable than the corresponding estimates of the numerators of the percentages, particularly if the percentages are 50 percent or more. When the numerator and denominator of the percentage are in different categories, use the factor or parameter from table B-3 indicated by the numerator.

The approximate standard error, $s_{x,p}$, of an estimated percentage can be obtained by use of the formula

$$s_{x,p} = fs \qquad (3)$$

In this formula, f is the appropriate factor from tables B-1 and B-2, and s is the standard error of the estimate obtained by interpolation from table B-2.

Alternatively, formula (4) will provide more accurate results:

$$s_{x,p} = \sqrt{\frac{b}{x}p(100 - p)} \qquad (4)$$

Here x is the total number of persons, families, households, or unrelated individuals which is the base of the percentage, p is the percentage ($0 \leq p \leq 100$), and b is the parameter in table B-3 associated with the characteristic in the numerator of the percentage.

Illustration of the computation of the standard error of a percentage. Table B shows that of the 76,716,000 males in 1988, 6,706,000 or 8.7 percent had a work disability. Using formula (3), the appropriate factor from table B-3, (0.9), and interpolation from table B-2, the approximate standard error is 0.9 x 0.2 = 0.2 percent.

Using formula (4) the standard error of the percentage of males who had a work disability in 1988 is

$$s_{x,p} = \sqrt{\frac{2{,}013}{76{,}716{,}000}(8.7)(100.0-8.7)} = 0.1.$$

Consequently, the 90-percent confidence interval for the percentage of males with a work disability in 1988 is from 8.5 to 8.9 percent.

Standard error of a difference. The standard error of the difference between two sample estimates is approximately equal to

$$S_{x-y} = \sqrt{S_x^2 + S_y^2} \qquad (5)$$

where s_x and s_y are the standard errors of the estimates, x and y. The estimates can be numbers, percentages, ratios, etc. This will represent the actual standard error quite accurately for the difference between estimates of the same characteristic in two different areas, or for the difference between separate and uncorrelated characteristics in the same area. However, if there is a high positive (negative) correlation between the two characteristics, the formula will overestimate (underestimate) the true standard error.

Illustration of the computation of the standard error of a difference. Table B shows that 3,791,000 males had a severe work disability in 1988 (x), and 3,666,000 females had a severe work disability in 1988 (y). The apparent difference between x and y is approximately 125,000.

As mentioned before, the approximate standard error of the estimated 3,791,000 males with a severe work disability in 1988 is 85,000. Similarly, the approximate standard error of the estimated number of females with a severe work disability in 1988 is approximately 84,000.

Using formula (5) the approximate standard error of the estimated difference between x and y is

$$s_{x-y} = \sqrt{(85{,}000)^2 + (84{,}000)^2} = 120{,}000$$

This means that the 90-percent confidence interval for the difference between males and females with a severe work disability in 1988 is from -67,000 to 317,000. Since this interval contains zero, we cannot conclude with 90-percent confidence that the number of males with a severe work disability in 1988 is greater than the number of females with a severe work disability in 1988.

Standard error of a median. The sampling variability of an estimated median depends on the form of the distribution and the size of the base. One can approximate the reliability of an estimated median by determining a confidence interval about it. (See the section on sampling variability for a general discussion of confidence intervals.)

Estimate the 68-percent confidence limits of a median based on sample data using the following procedure.

1. Determine, using formula (4), the standard error of the estimate of 50 percent from the distribution.

2. Add to and subtract from 50 percent the standard error determined in step 1.

3. Using the distribution of the characteristic, determine upper and lower limits of the 68-percent confidence interval by calculating values corresponding to the two points established in step 2.

   Use the following formula to calculate the upper and lower limits.

$$X_{pN} = \frac{pN - N_1}{N_2 - N_1}(A_2 - A_1) + A_1 \qquad (6)$$

   where

   X_{pN} = estimated upper and lower bounds for the confidence interval ($0 \leq p \leq 1$). For purposes of calculating the confidence interval, p takes on the values determined in step 2. Note that X_{pN} estimates the median when p = 0.50.

   N = for distribution of numbers: the total number of units (persons, households, etc.) for the characteristic in the distribution.

   = for distribution of percents: the value 1.0.

   p = the values obtained in step 2.

   A_1, A_2 = the lower and upper bounds, respectively, of the interval containing X_pN.

   N_1, N_2 = for distribution of numbers: the estimated number of units (persons, households, etc.) with values of the characteristic greater than or equal to A_1 and A_2, respectively.

   = for distribution of percentages: the estimated percentage of units (persons, households, etc.) having values of the characteristic greater than or equal to A_1 and A_2, respectively.

4. Divide the difference between the two points determined in step 3 by two to obtain the standard error of the median.

Illustration of the computation of a standard error for a median. Table 3 shows that the median income of persons with a work disability in 1988 is $6,323 and that the base of the distribution from which the median was determined is 13,420,000 persons.

1. Using formula (4) with b = 2,327 from table B-3, the standard error of 50 percent on a base of 13,420,000 is

$$\sqrt{\frac{2{,}327}{13{,}420{,}000}}(50.0)(100.0-50.0)=0.7\textit{percent}.$$

2. To obtain a 68-percent confidence interval, add to and subtract from 50 percent the standard error found in step 1. This yields percentage limits of 49.3 and 50.7.

3. The estimated numbers of persons with a work disability, and with incomes of at least $4,000 and at least $6,000, are 7,196,000 and 5,770,000 respectively. These estimates correspond to 53.6 and 43.0. Thus, the confidence interval around the median falls entirely within this income range.

   Using formula (6), the lower limit for the confidence interval of the median is found to be about

$$\frac{(0.507)(13{,}420{,}000)-7{,}196{,}000}{5{,}770{,}000-7{,}196{,}000}(\$2{,}000)+\$4{,}000=\$4{,}550.$$

   Similarly, the upper limit is found to be about

$$\frac{(0.493)(13{,}420{,}000)-7{,}196{,}000}{5{,}770{,}000-7{,}196{,}000}(\$2{,}000)+\$4{,}000=\$4{,}813.$$

   Thus, the 68-percent confidence interval for the median income of persons with a work disability in 1988 is from $4,550 to $4,813.

4. The standard error of median income is, therefore,

$$\frac{\$4{,}813-\$4{,}550}{2}=\$132.$$

Table B-1. Standard Errors of Estimated Numbers

Size of estimate (thousands)	Standard error		
	Total or White	Black	Hispanic origin
25	8	8	8
75	13	13	13
100	15	15	15

INTRODUCTION
(Optional)

We have just completed the questions about employment and unemployment. Each March, the Census Bureau also collects information about the economic situation of Americans and their families for the previous year. I am going to ask these questions now. We don't expect all answers to be perfect, but please think about each question and answer it the best you can.

77. INTERVIEWER CHECK ITEM
TENURE *(from Control Card item 10)*
Owned or being bought 1
Rented 2
No cash rent 3

78. How many housing units are in this structure?
1 O 5–9 O
2 O 10+ O
3–4 O

79. INTERVIEWER CHECK ITEM
Some household members under age 16 O *(Ask 80)*
No household members under age 16 O *(Skip to 82)*

80. During 1987, how many of the children in this household under age 16 were covered by Medicare or Medicaid?
O All
O Some, but not all – Mark number
1 2 3 4 5 6 7 8 9 +
